                                                                                                                                                                                                                                                                                                                                                                                                                        AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases.                                                                                                                                                                                                                                                                                                                                                            -NUL-B
  This sequence shows Aspergillus niger cyclophilin-like peptidyl prolyl cistrans isomerase (CYPB). CYPB is capable of catalyzing the cistrans isomerization of a peptide bond on the N-terminal side of proline residues in polypeptides. CYPB are useful in methods for increasing the yield of secreted polypeptides from cells. The secreted polypeptides may be enzymes (such as chymostin, thaumatin or alpha-squarcossidase) that can be used in food processing, a pest toxin, adenosine diphosphate (ADP)-glucose pyrophosphorylase, a glucanase or beta-1,4-endoglucanase.
                                                                                                                                                                                                                                                                                                                                                                                                       Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

PEPTIDE BONDS IN OLIGOPETIDES.

- PEPTIDE BONDS IN OLIGOPETIDES.

- DEVELOPMENTAL STAGE: EXPRESSED IN ALL ERYTHROCTTIC STAGES, BUT HIGHEST LEVEL OF EXPRESSED IN ALL ERYTHROCTTIC STAGE.

- SIMILARITY BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.

R HSSP: POSO32: ACA6975.1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Marcon Sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

Part Peromycetes possess peptidy1-prolyl cis-trans isomerases that strongly resemble cyclophilins from eukaryotic organisms.";
Mol. Microbiol. 6:3551-3558(1992).
-!- FUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.
-!- ENZYME REGULATION: BINDS CYCLOSPORIN A (CSA). CSA MEDIATES SOME OF TISE SFPECTS VIA AN IMINIBITORY ACTION ON PPIASE.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC.
-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Metazoa; Nematoda; Chromadorea; Rhabditida; Rhabditoidea;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
   The present sequence is a polypeptide encoded by one of a large number of 5 EST9 derived from mRNAs encoding secreted proteins. The 5' EST9 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such EST9 are not well suited for isolating cDNA sequences have been obtained those cases where longer cDNA sequences have been obtained in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' EST9 are also used in diagnostic, foremsic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
             This sequence represents a cyclophilin B peptide of the invention. The
                              peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.
   New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

The invention relates to a composition for modulating somatolactogenic function, comprising oyclophilin B (GypB), a mutant of cyclophilin B (articularly a CypB mutant in which residues 2-12 of the mature protein care absent) or an inhibitor of the interaction of cyclophilin B with a somatolactogenic formone; The invention along the set of a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic function in the animal, and cyclophilin B mutant or a composition comprising of cyclophilin B is useful in the treatment of somatolactogenic function in the animal. A composition comprising cyclophilin B is useful in the treatment of impublication comprising cyclophilin B with a somatolactogenic formone, is useful for treating mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B with a somatolactogenic formone, is useful for treating HIV infection, breast and prostate cancer, glganism/acromegaly, and hyperprolactinaemia. The present sequence represents a human cyclophilin B creaminal mutant, CybB-AIAKE.

Sequence represents a human cyclophilin in the specification, but seed form the wild-type CybB sequence shown on pages 17-18.
   Novel composition for modulating somatolactogenic function, comprises cyclophilin B, its mutant or an inhibitor of interaction of cyclophilin B with somatolactogenic hormone \,
  Human cyclophilin B; CypB; prolactin-binding; growth hormone-binding; somatolactogenic function modulator; immunosuppression; short stature; muscle wastling; osteoporosis; HIV infection; breast cancer; prostate cancer; gigantian; acromegaly; hyperprolactinaemia; c-terminal deletion mutant; muteln.
  Human cyclophilin B (CypB) C-terminal deletion mutant, CypB-AIAKE.

function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (pypB), a method for cyclophilin B with a season; or an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone, protacting growth hormone). The invention also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic formone, and a method for functions using CypB and a somatolactogenic formone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic function in the animal, and cyclophilin B with a somatolactogenic hormone, is useful for inhibiting somatolactogenic function in the animal. A composition of cyclophilin B with a somatolactogenic hormone, is useful for treatment of a composition of composition of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprise composition comprise composition comprise composition composition comprise composition comprise composition         0

The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensis, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

mitochondrial function or dysfunctional cell survival, such as Alzheimer's disease, diabetes mellitus, Parkinson's disease, Huntington's disease, schizophrenia, mitochondrial encephalopathy, lactic acidosis, stroke, hyperprolliferative disorders e.g. cancer, and deafness.
   The present sequence represents human cyclophilin D which is a mitochondrial core component. Cyclophilins interact with other mitochondrial core components e.g. adenine nucleotide translocator (ANT) proteins to requilate MPT. ANT proteins are mitochondrial permeability transition (MTP) pore components responsible for mediating transport of ADP across the mitochondrial inner membrane. The present invention relates to a novel nucleic acid expression construct comprising a promoter operably linked to a polynucleotide encoding a mitochondrial poir component polypeptide (e.g. ANT) fused to an energy transfer molecule (ETM) protein (e.g. green fluorescent protein (GFP) or a FLASH sequence). The novel expression construct can alter mitochondrial membrane permeability transition and/or alter the interaction between

The method involves detecting the presence of a cervical cancer-associated protein (CVC) in a tissue or body fluid sample. The CVC is characterised as having a molecular weight of 44900-69400 Daltons as determined by sodium dodecyl-sulphate (SDS)-PAGE techniques and an isoelectric point (PI) of 5.1-6.6 as determined by standard isoelectric focusing techniques. The protein is further characterised as being a non-chromatin protein which is detectable at a higher level in a human
                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection and therapy of cervical cancer - using specific cervical cancer-associated proteins as targets for treatment or as indicators for detection

The polynucleotide sequences given in AAF33037 to AAF33085 encode the human secreted proteins given in AAB64666 to AAB64714. AAB64715 to AAB64771 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues are expressed in Examples of activities include: Cytostatic, antitheumatic; antithrhitic; dermalogical; cardiant; antihifiammatory; gastrointestinal; and anti-ulcer. The polynucleotides and polypeptides can be used in the prevention, treatment and diagnosis of diseases associated with inappropriate polypeptide expression. Disorders that may be treated or prevented include solid tumours, rheumatoid arthritis, psoriasis, diabetic retinopathy, myocardial angiogenesis, Crohn's disease and ulcers. The polynucleotides and their complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients may be in need of restorative therapy. The polypeptides
                                                                                                                                                                                                  ó
cervical cancer cell than in a normal human cervical cell, as determined by 2D-get alectrophoresis. The methods can be used for the early and rapid detection of cervical cancer, for treating cervical cancers and for monitoring the efficacy of such treatment.
                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted protein; diagnosis; cytostatic; antirheumatic; antiarthatic; dermalogical; cardiant; antiinflammatory; anti-ulcer; gastrointestinal; solid tumour; rhemmatoid arthritis; psoriasis; diabetic retinopathy; myocardial anglogenesis; Croin's disease;

may also be used as antigens in the production of antibodies against the polypeptide and in assays to identify modulators (agonists and antiagonists) of polypeptide expression and activity. The anti-polypeptide antibodies and antiagonists may also be used to down regulate expression and activity. AAR33036 to AAR53036 and AAR64665 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

The sequence given is encoded by the protein IA gene of Neisseria gonorrhoeae. PIA is a major outer membrane proteins of N. gonorrhoeae which act as a porin. Porins are believed to act in cells by channelling low molecular weight substances across the hydrophobic lipid outer membrane. Elucidation of the gene sequences of PIA and PIB allows the production of antigenic fragments by recombinant DNA techniques. These fragments can be used as immunogens in vaccine compositions for the prevention of gonorrhoea, and also on immunoassays for diagnosis of infection. See also AAR27484.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ZIP: 02109
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 9, Application US/09134852
Patent No. 6127148
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TELEPHONE: (617) 523-3400
TELEFAX: (617) 523-6440
TELEA: 200291 STRE UR
INFORMATION FOR SEQ ID NO: 9:
SEQUENCE CHARACTERISTICS:
LENGTH: 164 amino acids
TYPE: amino acid
STRANDEDNESS: unknown
                                                                                                                                                                                                                                           78.48;

Peptidylprolyl isomerase (EC 5.2.1.8) [similarity] - mouse (fragments)
N.Alternate names: cyclophilin homolog SIP24
C.Species: Was musculus (house mouse)
C.Species: Was musculus (house mouse)
C.Date: 25-Aug-1995 #sequence_revision 25-Aug-1995 #text_change 02-Sep-2000
C.Accession: A56814
